Final Project: Advanced SQL Techniques

Estimated time needed: 60 minutes

Scenario

You have to analyse the following datasets for the city of Chicago, as available on the Chicago City data portal.

- · Socioeconomic indicators in Chicago
- · Chicago public schools
- Chicago crime data

Based on the information available in the different tables, you have to run specific queries using Advanced SQL techniques that generate the required result sets.

The lab will be followed by a graded quiz that will have questions on all problems in this lab. Hence, remember to take screenshots of your SQL queries and their outputs for reference.

Objectives

After completing this lab, you will be able to:

- 1. Use joins to query data from multiple tables
- 2. Create and query views
- 3. Write and run stored procedures
- 4. Use transactions

Software Used in this Lab

In this lab, you will use MySQL is a Relational Database Management System (RDBMS) designed to efficiently store, manipulate, and retrieve data.

To complete this lab you will utilize MySQL relational database service available as part of IBM Skills Network Labs (SN Labs) Cloud IDE. SN Labs is a virtual lab environment used in this course.

Database Used in this Lab

Mysql_learners database has been used in this lab.

Here you will be creating and inserting data into the below mentioned 3 tables

- 1. chicago_public_schools
- 2. chicago socioeconomic data
- 3. chicago_crime

Here you will be using 3 dump files for this purpose.

chicago_public_schools

chicago crime

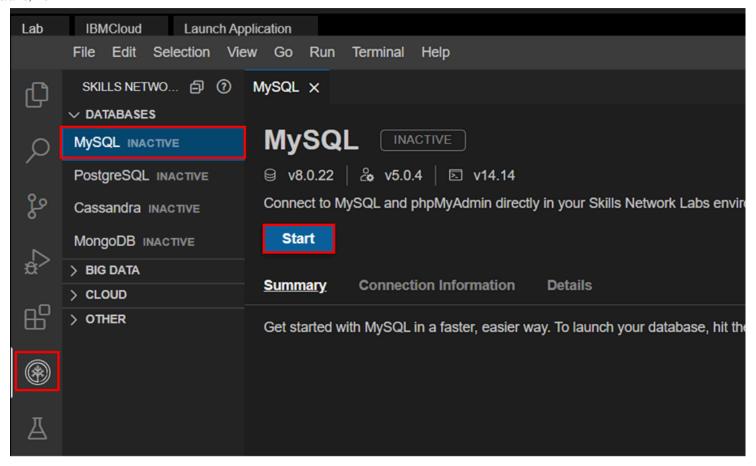

chicago socioeconomic data

Create the database

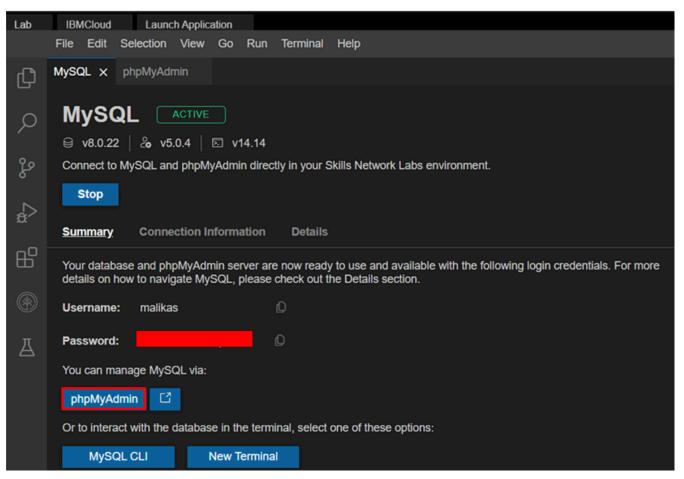

1. Click on Skills Network Toolbox. In Database section, click MySQL.

To start the MySQL click Start.

about:blank 1/10

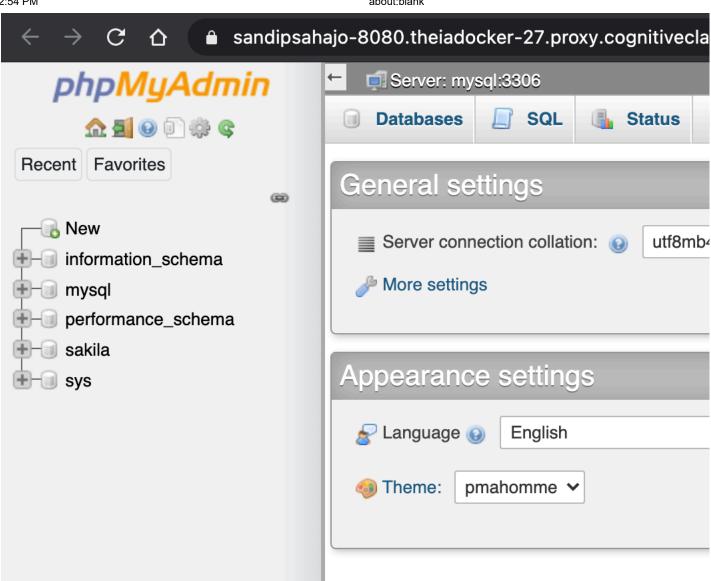

2. Once MySQL has started, click on phpMyAdmin button to open phpMyAdmin in the same window.

about:blank 2/10

3. You will see the phpMyAdmin GUI tool.

about:blank 3/10

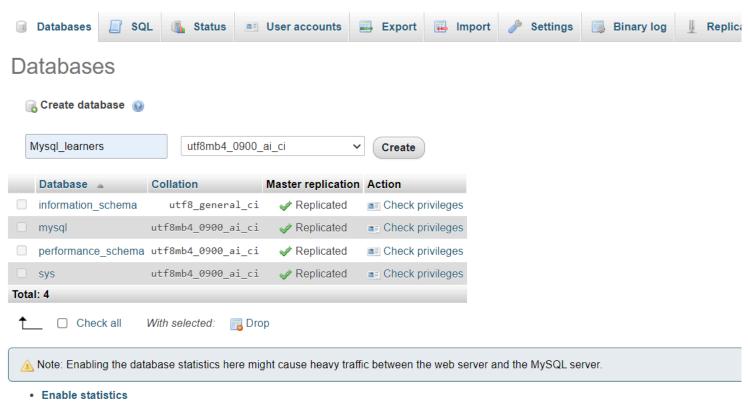

about:blank 4/10

4. In the tree-view, click New to create a new empty database. Then enter Mysql_Learners as the name of the database and click Create.

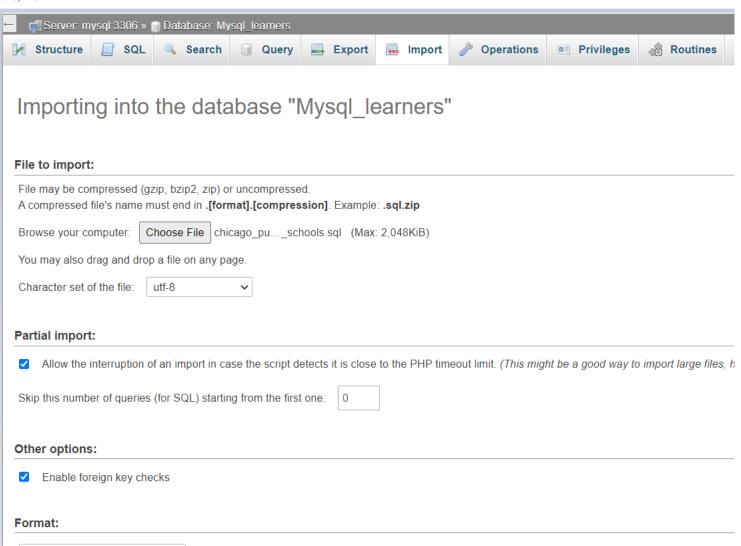

The encoding will be left as utf8mb4_0900_ai_ci. UTF-8 is the most commonly used character encoding for content or data.

Proceed to Task B.

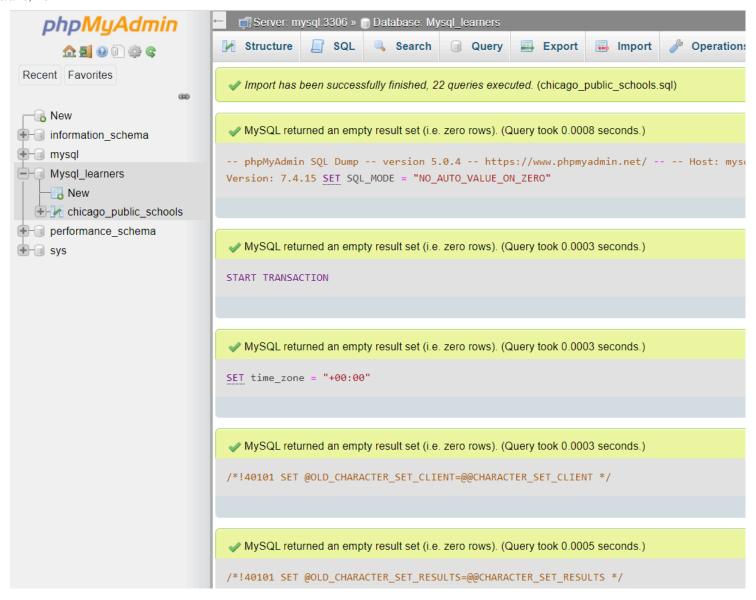

Load the dump files one by one into the database **Mysql_learners** by clicking the **Import** tab and choose the file. Click on **Go** button.

about:blank 5/10

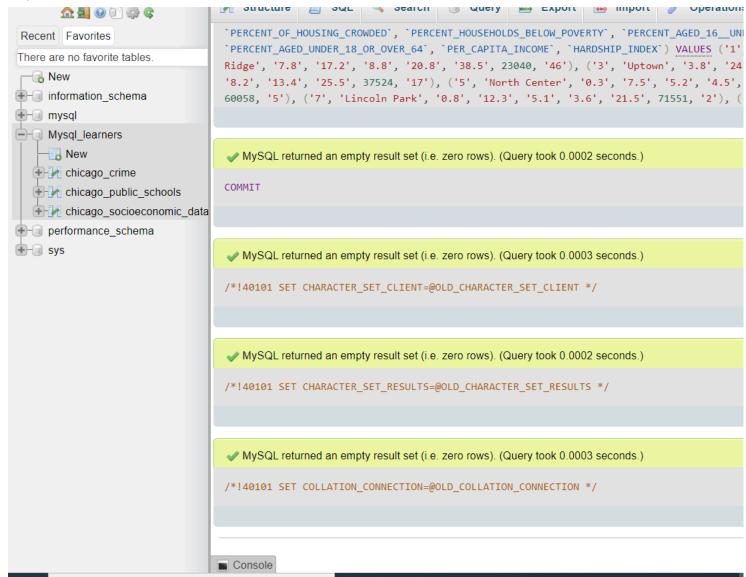

about:blank 6/10

The tables are created and the data is loaded successfully. Repeat the same operation with the other 2 dump files to create and load the tables.

You will see a screen as below

about:blank 7/10

Exercise 1: Using Joins

You have been asked to produce some reports about the communities and crimes in the Chicago area. You will need to use SQL join queries to access the data stored across multiple tables.

Question 1

• Write and execute a SQL query to list the school names, community names and average attendance for communities with a hardship index of 98.

▼ Hint 1

Use tables CHICAGO_PUBLIC_SCHOOLS and CHICAGO_SOCIO_ECONOMIC_DATA

▼ Hint 2

Use a left join

Take a screenshot showing the SQL query and its results.

Question 2

• Write and execute a SQL query to list all crimes that took place at a school. Include case number, crime type and community name.

▼ Hint 1

Use tables CHICAGO CRIME DATA and CHICAGO SOCIOECONOMIC DATA

▼ Hint 2

Use a left join

▼ Hint 3

The column location_description will help you find the crime location $% \left(1\right) =\left(1\right) \left(1$

Take a screenshot showing the SQL query and its results.

Exercise 2: Creating a View

about:blank 8/10

For privacy reasons, you have been asked to create a view that enables users to select just the school name and the icon fields from the CHICAGO_PUBLIC_SCHOOLS table. By providing a view, you can ensure that users cannot see the actual scores given to a school, just the icon associated with their score. You should define new names for the view columns to obscure the use of scores and icons in the original table.

Question 1

. Write and execute a SQL statement to create a view showing the columns listed in the following table, with new column names as shown in the second column.

| Column name in CHICAGO_PUBLIC_SCHOOLS | Column name in view | |
|---------------------------------------|---------------------|--|
| NAME_OF_SCHOOL | School_Name | |
| Safety_Icon | Safety_Rating | |
| Family_Involvement_Icon | Family_Rating | |
| Environment_Icon | Environment_Rating | |
| Instruction_Icon | Instruction_Rating | |
| Leaders_Icon | Leaders_Rating | |
| Teachers_Icon | Teachers_Rating | |

- Write and execute a SQL statement that returns all of the columns from the view.
- Write and execute a SQL statement that returns just the school name and leaders rating from the view.

Take a screenshot showing the last SQL query and its results.

Exercise 3: Creating a Stored Procedure

The icon fields are calculated based on the value in the corresponding score field. You need to make sure that when a score field is updated, the icon field is updated too. To do this, you will write a stored procedure that receives the school id and a leaders score as input parameters, calculates the icon setting and updates the fields appropriately.

Question 1

• Write the structure of a query to create or replace a stored procedure called UPDATE_LEADERS_SCORE that takes a in_School_ID parameter as an integer and a in Leader Score parameter as an integer.

Take a screenshot showing the SQL query.

Question 2

• Inside your stored procedure, write a SQL statement to update the Leaders_Score field in the CHICAGO_PUBLIC_SCHOOLS table for the school identified by in School ID to the value in the in Leader Score parameter.

Take a screenshot showing the SQL query.

Question 3

Inside your stored procedure, write a SQL IF statement to update the Leaders_Icon field in the CHICAGO_PUBLIC_SCHOOLS table for the school identified by
in_School_ID using the following information.

| Score lower limit | Score upper limit | Icon |
|-------------------|-------------------|-------------|
| 80 | 99 | Very strong |
| 60 | 79 | Strong |
| 40 | 59 | Average |
| 20 | 39 | Weak |
| 0 | 19 | Very weak |

[▼] Hint 1

Remember that once a clause of the IF statement executes, no further checking occurs and processing moves to the code below the IF statement.

▼ Hint 2

Your IF statement should have a structure similar to:

IF in Leader Score > 0 AND in Leader Score < 20 THEN

-- update icon for 0-19

ELSEIF in_Leader_Score < 40 THEN

-- update icon for 20-39

about:blank 9/10

ELSEIF in_Leader_Score < 60 THEN

-- update icon for 40-59

ELSEIF in_Leader_Score < 80 THEN

-- update icon for 60-79

ELSEIF in Leader Score < 100 THEN

-- update icon for 80-99

END IF;

Take a screenshot showing the SQL query.

Question 4

• Run your code to create the stored procedure.

Take a screenshot showing the SQL query and its results.

• Write a query to call the stored procedure, passing a valid school ID and a leader score of 50, to check that the procedure works as expected.

Exercise 4: Using Transactions

You realise that if someone calls your code with a score outside of the allowed range (0-99), then the score will be updated with the invalid data and the icon will remain at its previous value. There are various ways to avoid this problem, one of which is using a transaction.

Question 1

- Update your stored procedure definition. Add a generic ELSE clause to the IF statement that rolls back the current work if the score did not fit any of the preceding categories.
- ▶ Hint 1

Take a screenshot showing the SQL query.

Question 2

• Update your stored procedure definition again. Add a statement to commit the current unit of work at the end of the procedure.

▼ Hint

Remember that as soon as any code inside the IF/ELSE IF/ELSE statements completes, processing resumes after the END IF, so you can add your commit code there.

Take a screenshot showing the SQL query.

- Run your code to replace the stored procedure.
- Write and run one query to check that the updated stored procedure works as expected when you use a valid score of 38.
- Write and run another query to check that the updated stored procedure works as expected when you use an invalid score of 101.

Conclusion

You can now write advanced SQL statements to query data from multiple tables, to obscure sensitive data from users, and to control how information is updated in your tables.
